

Reading numbers from a text file and print it out on the website.

Example:

```
root@kenny:/srv/http
<html>
  <head>TestDB</head>

  <body>
    <h1>RANDOM</h1>
    <?php
      $lines = file('/srv/http/data.txt');
      foreach ($lines as $line_num => $line )
      {
        print "Line #{ $line_num } : " . $line . "<br />\n";
      }

    ?>
  </body>
</html>
~
~
~
~
```

I created a text file already called data.txt with a number on each line.

What this code does is it can take read each line in the foreach statement and print them out as it is being read. What I plan to do with this is to be able to read data from a file and be able to place them into my MySQL database and display them on my website.

Here is how this code shows up on my website.
